

## CLEAN AND RECYCLE YOUR OWN STORED FUEL

FRS-90

It is a known fact stored fuel (especially diesel fuel) breed's contamination. Install RCI Technologies' Fuel Recirculating System to keep your stored fuel in condition to enable your equipment to provide the dependable and reliable operations your business requires.

RCI Technologies offers two different fuel recirculating systems. The FRS-660 is a permanently installed, fully automatic, programmable system capable of continuously circulating and cleaning up to 660 gallons of fuel per hour. The smaller system, FRS-90, relies on a manual timer and 12-volt fuel pump to circulate and clean over 500 gallons of fuel with each setting

Both RCI Technologies Fuel Recirculating Systems rely on the thoroughly tested and proven RCI purifier to remove water, algae, and solid contaminants. The incorporated magnetic fuel conditioning technology reverses the natural process of diesel fuel degradation that results in tank sludge build up and poor fuel combustibility.

All RCI Technologies Fuel Recirculating Systems contain no filters and no moving parts. There are no filter elements or cartridges to change, clean, or replace. Our units are truly THE PERMANENT SOLUTION to protecting your equipment investment.
